Ensupra Electricity Usage Monitor, Power Meter, Reduce Your Energy Costs

Product Description Power Meter measures energy and cost of electric appliances, and help user reduce the power bill and carbon emissions. Connect this meter into your regular home 110V-120V AC power supply outlet and then, connect the electric appliances with the meter; it starts to work and shows you Watts taken by the appliance, records kWh (units of electricity) consumed over the time, shows how clean the electricity is by Power Factor, shows Co2 produced for this power and shows the cost to operate. Graphic displays electric consumption by the kilowatt-hour in 7-bar graph format (Past 7 days, Past 7 weeks and Past 7 months). This Monitor is also made for advanced user to set single electric rate tariff or dual rate tariff (time wise). There is RESET red dot for re-setting all the numbers. Multipline display for simultaneous reading power and cost. Much advanced features Displays volt, amp, watt, kWh / unit of electricity, time, cost and kg of Co2 Search Ensupra for our Plug'n play Energy Products of Your Choice

This worked at first. Then after not using it for about 5 days, the unit went dead. I replaced the internal batteries and it came back on, but it would'n't work anymore. I contacted the company, and they said that I had a very unique problem, and they would send me another one if I filled out their contact page. Nothing happened, and says it can't be returned. So I'm at a loss.
I bought one earlier and liked it so much that I bought the second one. I love this handheld ensupra energy monitor. I have tried other electricity monitors like kill a watt and I like the multi line, multi parameter display on the large display. At one time, it gives me watts that my appliance is using and my electricity units used so far. I would like to highly recommend.

I found out that my Samsung 32in LED TV uses 55 watts with the backlight at '20' but only 48 watts at '18' (and the brightness difference is barely noticeable). I found out that my Roku 2 XS uses less than 2 watts, even when streaming HD video. And my Kensington iPhone Dock only uses around 6 watts when it's charging my phone. On the other hand, I found out that my Emerson 900 watt microwave actually uses more than 1,400 watts. WATT?! Even just the lightbulb inside uses 25 watts. And my Lasko Box Fan's 3 settings use 75, 100, and 130 watts. That seems like a lot. A lot of watts. Basically, this gadget is fun to play with, easy to use, and doesn't block the bottom outlet of a regular outlet box.

What's not to like? However, I also bought an ALEKO Electricity Usage Monitor that costs 20% less... and also appears to be the EXACT same product, just with a different font on the 1-page instruction insert, and no brand name on the front. And the readings it gives are spot-on with the readings of this Ensupra-branded version. Like, they're not just similar, or one is a knock-off of the other. They're the same exact thing. Well, to be fair, the Ensupra included a glossy advertisement for their solar panel product. No such luxuries with the ALEKO. As a side note, I posted this same review for each product, and you'll see an "Verified Purchase" identifier on both to prove that I really do have both versions (and they really are identical).
